COMPSCI/SFWRENG 2FA3

Discrete Mathematics with Applications II Winter 2021

Assignment 1

Dr. William M. Farmer and Dr. Mehrnoosh Askarpour McMaster University

Revised: January 21, 2021

Assignment 1 consists of some background definitions, two sample problems, and two required problems. You must write your solutions to the required problems using LaTeX. Use the solutions of the sample problems as a guide.

Please submit Assignment 1 as two files, Assignment_1_YourMacID.tex and Assignment_1_YourMacID.pdf, to the Assignment 1 folder on Avenue under Assessments/Assignments. YourMacID must be your personal MacID (written without capitalization). The Assignment_1_YourMacID.tex file is a copy of the LaTeX source file for this assignment (Assignment_1.tex found on Avenue under Contents/Assignments) with your solution entered after each required problem. The Assignment_1_YourMacID.pdf is the PDF output produced by executing

pdflatex Assignment_1_YourMacID

This assignment is due **Sunday**, **January 31**, **2021** before midnight. You are allow to submit the assignment multiple times, but only the last submission will be marked. **Late submissions and files that are not named exactly as specified above will not be accepted!** It is suggested that you submit your preliminary <code>Assignment_1_YourMacID</code>. tex and <code>Assignment_1_YourMacID</code>. pdf files well before the deadline so that your mark is not zero if, e.g., your computer fails at 11:50 PM on January 31.

Although you are allowed to receive help from the instructional staff and other students, your submission must be your own work. Copying will be treated as academic dishonesty! If any of the ideas used in your submission were obtained from other students or sources outside of the lectures and tutorials, you must acknowledge where or from whom these ideas were obtained.

Background

1. The notation $\sum_{i=m}^{n} f(i)$ is defined by:

$$\sum_{i=m}^{n} f(i) = \begin{cases} 0 & \text{if } m > n \\ \left(\sum_{i=m}^{n-1} f(i)\right) + f(n) & \text{if } m \le n \end{cases}$$

2. The notation $\prod_{i=m}^{n} f(i)$ is defined by:

$$\prod_{i=m}^n f(i) = \left\{ \begin{array}{ll} 1 & \text{if } m > n \\ \left(\prod_{i=m}^{n-1} f(i)\right) * f(n) & \text{if } m \leq n \end{array} \right.$$

3. The factorial function fact : $\mathbb{N} \to \mathbb{N}$ is defined by:

$$\mathsf{fact}(n) = \left\{ \begin{array}{ll} 1 & \text{if } n = 0 \\ \mathsf{fact}(n-1) * n & \text{if } n > 0 \end{array} \right.$$

4. The Fibonacci sequence fib : $\mathbb{N} \to \mathbb{N}$ is defined by:

$$\mathsf{fib}(n) = \begin{cases} 0 & \text{if } n = 0\\ 1 & \text{if } n = 1\\ \mathsf{fib}(n-1) + \mathsf{fib}(n-2) & \text{if } n \ge 2 \end{cases}$$

Sample Problems

1. Prove $\sum_{i=0}^{n-1} 2^i = 2^n - 1$ for all $n \in \mathbb{N}$.

Proof. Let $P(n) \equiv \sum_{i=0}^{n-1} 2^i = 2^n - 1$. We will prove P(n) for all $n \in \mathbb{N}$ by weak induction.

Base case: n = 0. We must show P(0).

$$\sum_{i=0}^{0-1} 2^{i} \qquad \langle \text{LHS of } P(0) \rangle$$

$$= \sum_{i=0}^{-1} 2^{i} \qquad \langle \text{arithmetic} \rangle$$

$$= 0 \qquad \langle \text{definition of } \sum_{i=m}^{n} f(i) \text{ when } m > n \rangle$$

$$= 1 - 1 \qquad \langle \text{arithmetic} \rangle$$

$$= 2^{0} - 1 \qquad \langle \text{arithmetic}; \text{RHS of } P(0) \rangle$$

So P(0) holds.

Induction step: $n \ge 0$. Assume P(n). We must show P(n+1).

$$\sum_{i=0}^{(n+1)-1} 2^{i} \qquad \langle \text{LHS of } P(n+1) \rangle$$

$$= \sum_{i=0}^{n} 2^{i} \qquad \langle \text{arithmetic} \rangle$$

$$= \left(\sum_{i=0}^{n-1} 2^{i}\right) + 2^{n} \qquad \langle \text{definition of } \sum_{i=m}^{n} f(i) \rangle$$

$$= \left(2^{n} - 1\right) + 2^{n} \qquad \langle \text{induction hypothesis: } P(n) \rangle$$

$$= 2 * 2^{n} - 1 \qquad \langle \text{arithmetic} \rangle$$

$$= 2^{n+1} - 1 \qquad \langle \text{arithmetic; RHS of } P(n+1) \rangle$$

So P(n+1) holds.

Therefore, P(n) holds for all $n \in \mathbb{N}$ by weak induction.

2. Prove that, if $n \in \mathbb{N}$ with $n \geq 2$, then n is a prime number or a product of prime numbers.

Proof. Let P(n) hold iff n is a product of prime numbers. We will prove P(n) for all $n \in \mathbb{N}$ with $n \geq 2$ by strong induction.

Base case: n = 2. We must show P(2). Since 2 is a prime number, P(2) obviously holds.

Induction step: n > 2. Assume $P(2), P(3), \ldots, P(n-1)$ hold. We must show P(n).

Case 1: n is a prime number. Then P(n) obviously holds.

Case 2: n is not a prime number. Then n = x * y where $x, y \in \mathbb{N}$ with $2 \le x, y \le n-1$. Thus, by the induction hypothesis (P(x)) and P(y),

$$x = p_0 * \cdots * p_i$$

and

$$y = q_0 * \cdots * q_j$$

where $p_0, \ldots, p_i, q_0, \ldots, q_j$ are prime numbers. Then

$$n = x * y = p_0 * \cdots * p_i * q_0 * \cdots * q_i$$

and so P(n) holds since n is a product of prime numbers.

Therefore, P(n) holds for all $n \in \mathbb{N}$ with $n \geq 2$ by strong induction. \square

Required Problems

1. [10 points] Prove

$$\sum_{i=0}^n i * \mathsf{fact}(i) = \mathsf{fact}(n+1) - 1$$

for all $n \in \mathbb{N}$.

Qiang Gao, gaoq20, 1/31

Proof. $P(n) \equiv \sum_{i=0}^{n} i * \mathsf{fact}(i) = \mathsf{fact}(n+1) - 1$. We will prove P(n) for all $n \in \mathbb{N}$ by weak induction. Base case: P(0)

$$\sum_{i=0}^{0} i * \operatorname{fact}(i) \qquad \langle \operatorname{LHS} \text{ of } P(0) \rangle$$

$$= \sum_{i=0}^{0-1} i * \operatorname{fact}(i) + 0 * \operatorname{fact}(0) \qquad \langle \operatorname{definition of } \sum_{i=m}^{n} f(i) \text{ when } m \leq n \rangle$$

$$= \sum_{i=0}^{-1} i * \operatorname{fact}(i) \qquad \langle \operatorname{arithmetic} \rangle$$

$$= 0 \qquad \langle \operatorname{definition of } \sum_{i=m}^{n} f(i) \text{ when } m > n \rangle$$

$$= 1 * 1 - 1 \qquad \langle \operatorname{arithmetic} \rangle$$

$$= \operatorname{fact}(0) * 1 - 1 \qquad \langle \operatorname{definition of } \operatorname{fact}(n) \text{ when } n = 0 \rangle$$

$$= \operatorname{fact}(1 - 1) * 1 - 1 \qquad \langle \operatorname{definition of } \operatorname{fact}(n) \text{ when } n > 0 \rangle$$

$$= \operatorname{fact}(0 + 1) - 1 \qquad \langle \operatorname{arithmetic}; \operatorname{RHS} \operatorname{of } P(n + 1) \rangle$$

P(0) holds. Induction step: $n \ge 0$. We show P(n+1) assuming P(n).

$$\sum_{i=0}^{n+1} i * \mathsf{fact}(i) \qquad \langle \mathsf{LHS} \; \mathsf{of} \; P(n+1) \rangle$$

$$= \sum_{i=0}^{n} i * \mathsf{fact}(i) + (n+1) * \mathsf{fact}(n+1) \qquad \langle \mathsf{definition} \; \mathsf{of} \; \sum_{i=m}^{n} f(i) \rangle$$

$$= \mathsf{fact}(n+1) - 1 + (n+1) * \mathsf{fact}(n+1) \qquad \langle \mathsf{induction} \; \mathsf{hypothesis:} \; P(n) \rangle$$

$$= (n+1+1) * \mathsf{fact}(n+1+1-1) - 1 \qquad \langle \mathsf{arithmetic} \rangle$$

$$= \mathsf{fact}((n+1)+1) - 1 \qquad \langle \mathsf{definition} \; \mathsf{of} \; \mathsf{fact}(n); \; \mathsf{RHS} \; \mathsf{of} \; P(n+1) \rangle$$

P(n+1) holds.

Therefore, P(n) holds for all $n \in \mathbb{N}$ by weak induction.

2. **[10 points]** Prove that, for all $n \in \mathbb{N}$, fib(n) is even if n = 3k for some $k \in \mathbb{N}$, is odd if n = 3k + 1 for some $k \in \mathbb{N}$, and is odd if n = 3k + 2 for some $k \in \mathbb{N}$.

Qiang Gao, gaoq20, 1/31

Proof. Let P(n) holds iff fib(n) is even if n = 3k for some $k \in \mathbb{N}$, is odd if n = 3k + 1 for some $k \in \mathbb{N}$, and is odd if n = 3k + 2 for some $k \in \mathbb{N}$. We will prove P(n) for all $n \in \mathbb{N}$ with $k \in \mathbb{N}$ by strong induction.

Base case:

Case 1: P(0): fib(0) = 0, which is even, and 0 = 3 * 0, P(0) holds.

Case 2: P(1): fib(1) = 1, which is odd, and 1 = 3 * 0 + 1, P(1) holds.

Case 3: P(2): fib(2) = 1, which is odd, and 2 = 3 * 0 + 2, P(2) holds.

Induction Step: $n \ge 1$. We must show P(n) holds assuming P(a), a<n holds.

Case 1: n = 3k. We must show P(n) is even.

$$\begin{aligned} &\text{fib}(3k) && \langle \text{LHS of } P(n) \rangle \\ &= &\text{fib}(3k-1) + &\text{fib}(3k-2) && \langle \text{definition of fib}(n) \text{ when } n \geq 2 \rangle \\ &= &\text{fib}(3*(k-1)+2) + &\text{fib}(3*(k-1)+1) && \langle \text{arithmetic} \rangle \end{aligned}$$

According to P(n), 3 * (k - 1) + 2 indicates that fib (3 * (k - 1) + 2) is an odd number, 3 * (k - 1) + 1 indicates that fib (3 * (k - 1) + 1) is an odd number, and an odd number plus odd number results an even number, Case 1 holds.

Case 2: n = 3k + 1. We must show P(n) is odd.

$$\begin{aligned} &\mathsf{fib}(3k+1) & & & & & & & & \\ &= &\mathsf{fib}((3k+1)-1) + &\mathsf{fib}((3k+1)-2) & & & & & & \\ &= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & & & \\ &= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3*(k-1)+2) & & \\ &&= &\mathsf{fib}(3k) + &\mathsf{fib}(3k)$$

According to P(n), 3 * k indicates that fib (3*k) is an even number, 3 * (k - 1) + 2 indicates that fib (3 * (k - 1) + 2) is an odd number, and an even number plus odd number results an odd number, Case 2 holds.

Case 3: n = 3k + 2. We must show P(n) is odd.

$$\mathsf{fib}(3k+2)$$
 $\langle \mathsf{LHS} \ \mathsf{of} \ P(n) \rangle$
= $\mathsf{fib}((3k+2)-1) + \mathsf{fib}((3k+2)-2)$ $\langle \mathsf{definition} \ \mathsf{of} \ \mathsf{fib}(n) \ \mathsf{when} \ n \geq 2 \rangle$
= $\mathsf{fib}(3k+1) + \mathsf{fib}(3k)$ $\langle \mathsf{arithmetic} \rangle$

According to P(n), 3 * k + 1 indicates that fib (3*k + 1) is an odd number, 3 * k indicates that fib (3*k) is an even number, and an odd number plus even number results an odd number, Case 3 holds.

Therefore, P(n) holds for all $n \in \mathbb{N}$ by strong induction.
